

1. Producing the data

In this task, we will implement Apache Kafka producers to simulate real-time data streaming. Spark and parallel data processing should not be used in this section, as we are simulating sensors that often lack processing capabilities.

1. Every 1 second, load 50–100 accident records from the CSV file. You should keep a pointer in the file reading process and advance it per read. The data should be read in chronological order; just the number of records you read every second is a random number between 50 and 100 (inclusive).
2. Add the current timestamp (accident_ts) to the records.
3. Send your batch of accident data to a Kafka topic with an appropriate name.

Assignment 2B — Task 1: Kafka Producer

Author: bgan0012

This notebook implements a pure Python Kafka producer that reads `streaming_collision.csv` chronologically and publishes batches of 50–100 rows per second to the Kafka topic `accident_stream`. Each message includes an `accident_ts` field set to the current Unix timestamp at send time.

Imports

```
In [1]: # =====  
# Task 1 – Imports  
# Pure Python only – no Spark or PySpark imports permitted  
# =====  
  
import csv          # parse streaming_collision.csv row by row  
import json         # serialise each row as a JSON message  
import time         # control the 1-second send interval  
import random       # draw a fresh random batch size each second
```

```

from kafka import KafkaProducer # pure Python Kafka client – kafka-python

print("All imports successful.")
import kafka
print(f"kafka-python version: {kafka.__version__}")

```

All imports successful.
kafka-python version: 2.2.3

Configuration

Kafka broker address, topic name, and CSV path are defined as constants here. Kafka runs as a separate container named `kafka` on the `fit5202` Docker network — hence the broker address is `kafka:9092` rather than `localhost:9092`.

```

In [2]: # =====
# Task 1 – Producer Configuration
# =====

# Kafka broker – runs as a separate container on the fit5202
# Docker network; address is kafka:9092, not localhost:9092
BOOTSTRAP_SERVERS = "kafka:9092"

# Topic name as specified in the assignment
TOPIC_NAME = "accident_stream"

# Path to the streaming collision CSV
CSV_PATH = "streaming_collision.csv"

# Batch size bounds (inclusive) per spec: random int in [50, 100]
BATCH_MIN = 50
BATCH_MAX = 100

print(f"Bootstrap server : {BOOTSTRAP_SERVERS}")
print(f"Topic           : {TOPIC_NAME}")
print(f"CSV path          : {CSV_PATH}")
print(f"Batch size range : {BATCH_MIN}–{BATCH_MAX} rows/second")

```

```

Bootstrap server : kafka:9092
Topic            : accident_stream
CSV path         : streaming_collision.csv
Batch size range : 50-100 rows/second

```

Initialise Kafka Producer

The producer serialises each message value as a UTF-8 encoded JSON string. The key serialiser encodes `collision_index` as bytes to allow Kafka to route messages consistently by collision.

```

In [3]: # =====
# Task 1 - Initialise KafkaProducer
# =====

# value_serializer: each message value is a dict - serialise to
# a JSON string then encode to UTF-8 bytes for Kafka transport.
# key_serializer: collision_index string → UTF-8 bytes.
producer = KafkaProducer(
    bootstrap_servers=BOOTSTRAP_SERVERS,
    value_serializer=lambda v: json.dumps(v).encode("utf-8"),
    key_serializer=lambda k: k.encode("utf-8") if k else None
)

print(f"KafkaProducer initialised.")
print(f"Connected to : {BOOTSTRAP_SERVERS}")

```

```

KafkaProducer initialised.
Connected to : kafka:9092

```

Kafka Producer Loop

The producer reads `streaming_collision.csv` using a persistent file pointer that advances per read, maintaining chronological order across the full run. Every second, a fresh random batch size between 50 and 100 rows is drawn. Each row is sent as a JSON message with all original fields serialised as strings, plus `accident_ts` added as a numeric Unix timestamp (integer).

```

In [4]: # =====
# Task 1 - Producer Loop

```

```

#
# Design decisions:
# - csv.DictReader is re-opened each time the file is exhausted,
#   allowing the producer to loop indefinitely until manually
#   stopped. This ensures continuous data flow during the demo.
# - batch_size is re-drawn every second per spec.
# - accident_ts is added as a numeric Unix timestamp (int)
#   before sending - all other fields remain strings from
#   csv.DictReader and are sent as-is per spec.
# - producer.flush() after each batch ensures all buffered
#   messages are delivered before the 1-second sleep.
# - Loop runs until manually interrupted (KeyboardInterrupt).
# =====

sent_total = 0 # running count of messages sent across all batches
batch_num = 0 # batch counter for logging
loop_num = 0 # how many times the CSV has been fully replayed

try:
    while True:
        loop_num += 1
        print(f"--- Starting CSV pass {loop_num} ---")

        with open(CSV_PATH, newline="", encoding="utf-8") as csv_file:
            reader = csv.DictReader(csv_file) # fresh pointer each pass

            while True:
                # Draw a fresh random batch size each second per spec
                batch_size = random.randint(BATCH_MIN, BATCH_MAX)
                batch = []

                # Read the next batch_size rows from current pointer
                for _ in range(batch_size):
                    row = next(reader, None) # None = end of file
                    if row is None:
                        break
                    batch.append(row)

                # Inner loop exhausted - break to outer loop to reopen
                if not batch:
                    print(f"CSV pass {loop_num} complete. ")

```

```
        f"Total sent so far: {sent_total:,}")
    break

    # Add accident_ts as numeric Unix timestamp (integer)
    # All other fields remain as strings from DictReader
    current_ts = int(time.time())
    for row in batch:
        row["accident_ts"] = current_ts

    # Send each row to Kafka as a JSON message
    for row in batch:
        producer.send(
            TOPIC_NAME,
            key=row.get("collision_index", ""),
            value=row
        )

    # Flush ensures delivery before sleeping
    producer.flush()

    batch_num += 1
    sent_total += len(batch)

    print(f"Batch {batch_num:>4} | "
          f"rows: {len(batch):>3} | "
          f"total: {sent_total:>7,} | "
          f"pass: {loop_num} | "
          f"ts: {current_ts}")

    time.sleep(1) # wait 1 second before next batch

except KeyboardInterrupt:
    print(f"\nProducer stopped manually.")
    print(f"Total batches sent : {batch_num:,}")
    print(f"Total messages sent: {sent_total:,}")
    print(f"CSV passes completed: {loop_num}")
```

Generative AI Usage

The following table documents all use of generative AI tools in accordance with the Monash University Generative AI Assessment Policy (FIT5202, Semester 1 2026).

Tool	Version	Cell	Purpose	Representative Prompt
Claude	Sonnet 4.6 (claude.ai)	Imports	Confirming pure Python constraints and library selection for Task 1	"Task 1 must use pure Python only — no Spark or PySpark imports. What libraries are needed to build a Kafka producer that reads a CSV and sends JSON messages?"
Claude	Sonnet 4.6 (claude.ai)	Configuration	Clarifying Kafka broker address inside Docker network	"Why should the bootstrap server be kafka:9092 and not localhost:9092 when running inside the fit5202 Docker container?"
Claude	Sonnet 4.6 (claude.ai)	Initialise Kafka Producer	Serialiser design for mixed-type message values	"How should I configure the KafkaProducer value_serializer to send a dict where most fields are strings but accident_ts is an integer?"
Claude	Sonnet 4.6 (claude.ai)	Producer Loop	Persistent file pointer design and loop-back logic for continuous streaming	"How do I keep a persistent file pointer that advances per read in Python, and loop back to the start of the CSV when it is exhausted, while maintaining chronological order?"
