

FIT5147 S1 2026 Data Exploration Feedback

Student Name: Bharath Gandhimani (bgan0012)

Marker: Michael Niemann

Criteria	Excellent (HD)	Very Good (D)	Good (C)	Adequate (P)	Needs improvement (N)	Feedback
Data Checking and Wrangling (7%)						
HD: Excellence in data processing demonstrated and documented. Evidence of significant complexity in the wrangling, cleaning, transformation, or data collection (e.g., scraping). C: Good choices and clear justifications for error checking, cleaning and transforming of non-tabular data (e.g., spatial, relational, textual); large datasets (observations or dimensions) and/or multiple data sets. P: Appropriate data cleaning and checking. Demonstrated ability to get data into R or Tableau; N: Inappropriate checking, cleaning, or wrangling. 0: If no demonstration of data checking and cleaning.		X				Data well described. You have checked for outliers, irregularities, missing data, but no mention of data duplication. You have described data wrangling but nothing complex or overly extensive. Some data was merged. Data filtering was described and justified. Spatial, relational and tabular data was included. You have described and justified various limitations of the data and assumptions you made for the exploration. You have visualised the data but it was not included in the main content so is not assessable.
Data Visualisation and Design Choices (9%)						
HD: Variety of high-quality, complex and/or creative visualisations with high attention to detail. Clearly justified design choices incl. visualisation idioms, choice of visual variables, layout and labelling. C: Visualisations are appropriate for the intended purpose; appropriate labeling of axes and visualisations; clear legends when needed; saliency of patterns and trends. P: Suitable visualisations, which are well presented, described, readable and interpretable. N: No visualisations; unsuitable or poor choice of visualisations; pixelated / poor quality images or illegible visualisations. 0: If not using Tableau or R.	X					Most visualisations were well described and their design justified. The visualisations are borderline unreadable though. The text is too small. Good variety of visualisation types. Some are very complex multivariate visualisations, including violin graphs and annotations and multiple layers of data plotting, including analytical results. Good consistency of colours for Mode group but not for investment tiers. Fig 1: good Fig 2: If outliers are excluded, why is there one in Education Low? Fig 3: Good choice of visualisation. Fig 4 & 5: Good Fig 6: The yellow on grey is hard to read. Perhaps two maps might have been better to allow a zoom in around the bay for clarity. Colours inconsistent with previous graphs. Fig 7: Colour inconsistent with previous graphs
Analytical Methods and Interpretations (9%)						
HD: High quality of visual analysis demonstrated. Sophisticated and correctly used analytical methods such as clustering; dimensionality reduction; sophisticated aggregation and/or filtering; non-linear model fitting; correct use of statistical tests; or complex time series analysis. C: Analysis that is appropriate for the intended purpose; justification and explanation of the exploration process and use of statistical measures; identification of trends, patterns, and insights. P: Demonstrated suitable analysis and interpretation of the data and topic questions. N: Unsuitable analysis or misinterpretation of the data and topics questions. 0: If no data analysis is demonstrated.	X					Your exploration relates to your questions. Your analysis relates to your exploration and is justified. Your visualisations relate to your exploration. You have interpreted your visualisations. Statistical analysis was involved, including some complex methods like the Kruskal-Wallis test and the Dunn post-hockey tests. You explored the data from multiple perspectives, which gave it good depth.
Written Report: Quality/Completeness/thoroughness (8%)						
HD: Professional report with excellence of writing combined with high quality figures/images. Clearly articulated findings; awareness of limitations; deep exploration; thorough conclusions. C: High quality of writing and figures/images with minimal errors. Correct referencing of figures and tables within the text, and correctly used academic referencing of sources. P: Good report with logical structure with all the expected sections: Introduction, Data Wrangling, Data Checking, Data Exploration, Conclusion, Reflection, Bibliography. Referencing of sources, figures and tables. Correct grammar and spelling. N: Poor report, or missing sections.	X					Questions not clearly stated in introduction (dot points would have been better). Visualisations in the appendices were not considered when marking as they were not part of the assessable content. You numbered and captioned all your diagrams and clearly referred to them by this in your writing. Your reflection talks about your exploration but also some of the lessons you learnt about using different types of visualisation for visual analysis. The conclusion clearly associates the summarised findings with the questions. Your writing is clear, but does not cite a lot of your references, especially when introducing analytical methods like Kruskal-Wallis test. The data wrangling section discusses some limitations of the data and assumptions that were made.
FINAL MARK	X
