10/05/2026

CATEGORISE

Ideas that set context

#24, #25, #12.
Orient the reader before analysis.
Establishes scale, frames & questions
Shows which is more prominent

Ideas that frame the narrative

#25, #26.
Tells the reader what the data can show & not show

Ideas that show comparisons

#1, #2, #3, #5.
Let the reader see differences between groups or across an ordered axis

Ideas that structure reader's journey

#14, #15, #16.
Determines how reader navigates the narrative.

NOTE: #26 is repeated. It serves double duty. It contextualizes the reader's entry point & frames the narrative

Ideas that show distribution & variability

#4, #6. Reveals spread & shape behind summary statistics. Shows how much variation exists.

Both can be implemented in #11. Can repeat a comparison chart across subgroups & serve as layout device

Ideas that give readers control

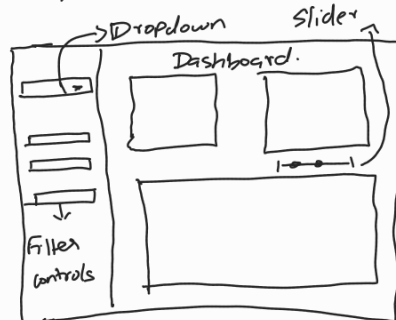

#18, #19, #20, #21.
Interactive components.
Not standard design but attachment to structures.

COMBINE & REFINE

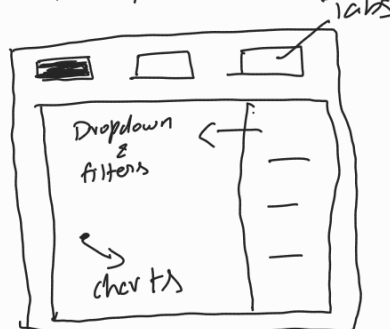

Design A

Design B

Design C

QUESTIONS

- Does any of the three designs give a policymaker a clear sense of what action to take or do all three leave the audience with unresolved questions?
- How much narrative text does a policy audience need alongside each chart before they understand its significance - and does any of the three candidates allocate enough space for that?

- If a reader enters the visualization at a point other than the beginning, can they still understand what they are looking at without having read the preceding sections?
- Does the sequential structure of Design A make losing a reader who is not interested in all three research questions equally?
- Does the simultaneous visibility of Design B create cognitive overload for a reader who is unfamiliar with the data?

- Does Design C chapter structure clearly communicate that the three chapters are parts of a single connected argument rather than three separate analyses?
- How do we communicate what the data cannot show - the structural gaps in coverage without it feeling like an excuse for incomplete analysis?
